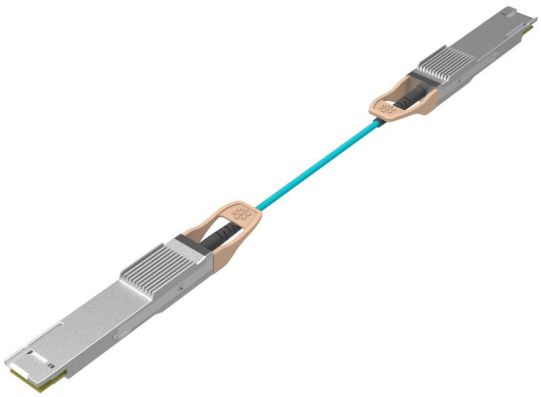
# 800G QSFPDD AOC Optical Transceiver Module
# P/N: GQD-MDO801-XXXC

## Features



- ✓ 8 channels full-duplex transceiver modules
- ✓ Transmission data rate up to 106.25G per channel
- ✓ 8x106.25Gbps PAM4 transmitter and PAM4 receiver
- ✓ 8 channels 850nm VCSEL array
- ✓ 8 channels PIN photo detector array
- ✓ Power consumption <14W per end
- ✓ Hot Pluggable QSFPDD form factor and Compliant with CMIS
- ✓ Maximum link length of 30m on OM3 Multimode Fiber (MMF)and 50m on OM4 MMF with FEC
- ✓ Built-in digital diagnostic functions
- ✓ Operating case temperature 0°C to +70°C
- ✓ 3.3V power supply voltage
- ✓ RoHS compliant(lead free)

## Applications

- ✓ IEEE 802.3db 2 x 400GBASE-SR4 Ethernet (PAM4)
- ✓ The transceiver is designed for Ethernet, Telecom and Infiniband use cases.

## Description

The Gigalight GQD-MDO801-XXXC is a Eight-Channel, Pluggable, Parallel, Fiber-Optic QSFPDD Double Density for 800 Gigabit Ethernet Applications. This transceiver is a high performance module for short-range multi-lane data communication and interconnection applications. It integrates eight data lanes in each direction with 8x53.125GBd. Each lane can operate at 106.25Gbps up to 30 m using OM3 fiber or 50 m using OM4 fiber with FEC. These modules are designed to operate over multimode fiber systems using a nominal wavelength of 850nm. The Common Management Interface Specification (CMIS) for OSFP modules, This module incorporates Gigalight Technologies proven circuit and VCSEL technology to provide reliable long life, high performance, and consistent service.

## Absolute Maximum Ratings

| Parameter | Symbol | Min | Max | Unit |
|---|---|---|---|---|
| Supply Voltage | Vcc | -0.3 | 3.6 | V |
| Input Voltage | Vin | -0.3 | Vcc+0.3 | V |
| Storage Temperature | Tst | -20 | 85 | ºC |
| Case Operating Temperature | Top | 0 | 70 | ºC |
| Humidity(non-condensing) | Rh | 5 | 95 | % |

## Recommended Operating Conditions

| Parameter | Symbol | Min | Typical | Max | Unit |
|---|---|---|---|---|---|
| Supply Voltage | Vcc | 3.13 | 3.3 | 3.47 | V |
| Operating Case temperature | Tca | 0 | | 70 | ºC |
| Data Rate Per Lane | | | 106.25 | | Gbps |
| Humidity | Rh | 5 | | 85 | % |
| Power Dissipation | Pm | | 13.5 | 14 | W |

## Electrical Specifications

| Parameter | Symbol | Min | Typical | Max | Unit |
|---|---|---|---|---|---|
| Differential input impedance | Zin | 90 | 100 | 110 | ohm |
| Differential Output impedance | Zout | 90 | 100 | 110 | ohm |

| Parameter | Symbol | Min | Typical | Max | Unit |
|---|---|---|---|---|---|
| Differential input voltage amplitude aAmplitude | ΔVin | 400 | | 900 | mVp-p |
| Differential output voltage amplitude | ΔVout | | | 850 | mVp-p |
| Bit Error Rate | BER | | | 2.4E-4 | - |
| Input Logic Level High | $V_{IH}$ | 2.0 | | $V_{cc}$ | V |
| Input Logic Level Low | $V_{IL}$ | 0 | | 0.8 | V |
| Output Logic Level High | $V_{OH}$ | $V_{cc}$-0.5 | | $V_{cc}$ | V |
| Output Logic Level Low | $V_{OL}$ | 0 | | 0.4 | V |
| Input Logic Level High | $V_{IH}$ | 2.0 | | $V_{cc}$ | V |

**Note：**

1. BER=2.4E-4; PRBS31Q@53.125GBd. Pre-FEC
2. Differential input voltage amplitude is measured between TxnP and TxnN.
3. Differential output voltage amplitude is measured between RxnP and RxnN.

## Optical Characteristics

### Table 3 - Optical Characteristics

| Parameter | Symbol | Min | Typical | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| **Transmitter** | | | | | | |
| Centre Wavelength | λc | 842 | 850 | 948 | nm | - |
| RMS spectral width | Δλ | - | - | 0.65 | nm | - |
| Average launch power, each lane | Pout | -4.6 | - | 5.5 | dBm | - |
| Optical Modulation Amplitude (OMAouter), each lane | OMA | -2.6 | | 4 | dBm | - |
| Transmitter and dispersion eye closure for PAM4(TDECQ),each lane | TDECQ | | | 4.4 | dB | |
| Extinction Ratio | ER | 2.5 | - | - | dB | - |
| Average launch power of OFF transmitter, each lane | | | | -30 | dB | - |
| **Receiver** | | | | | | |

| Parameter | Symbol | Min | Typical | Max | Unit | Notes |
|---|---|---|---|---|---|---|
| Centre Wavelength | λc | 842 | 850 | 948 | nm | - |
| Receiver Sensitivity in OMAout | RXsen | | | max (-4.4,TECQ-6.2) | dBm | 1 |
| Stressed Receiver Sensitivity in OMAout | SRS | | | -1.8 | dBm | 2 |
| Maximum Average power at receiver , each lane input, each lane | | | | 5.5 | dBm | - |
| Minimum Average power at receiver , each lane | | -6.3 | | | dBm | |
| Receiver Reflectance | | | | -15 | dB | - |
| LOS Assert | LOSA | -15 | | -8.5 | dBm | - |
| LOS De-Assert | LOSD | | | -6.5 | dBm | - |
| LOS Hysteresis | LOSH | 0.5 | | | dB | - |

**Note：**

1. Measured with conformance test signal at TP3 for BER = 2.4E-4 Pre-FEC.
2. These test conditions are for measuring stressed receiver sensitivity. They are not characteristics of the receiver.

## Digital Diagnostic Specification

| Parameter | Symbol | Min | Typical | Max | Units | Notes |
|---|---|---|---|---|---|---|
| Transceiver Case Temperature | DMI_Temp | -3 | | +3 | ℃ | Over operating temp |
| Supply voltage monitor absolute error | DMI _VCC | -0.1 | | 0.1 | V | Full operating range |
| Channel RX power monitor absolute error | DMI_RX | -2 | | +2 | dB | Per channel |
| Channel Bias current monitor | DMI_Ibias | -10% | | +10% | mA | Per channel |
| Channel TX power monitor absolute error | DMI_TX | -2 | | +2 | dB | Per channel |

## Pin Description

Table 1- Pad Function Definition

| Pad | Logic | Symbol | Description | Plug Sequence[4] | Notes |
|---|---|---|---|---|---|
| 1 | | GND | Ground | 1B | 1 |
| 2 | CML-I | Tx2n | Transmitter Inverted Data Input | 3B | |

| 75 | CML-I | Tx5n | Transmitter Inverted Data Input | 3A | |
| 76 | | GND | Ground | 1A | 1 |

Note 1: QSFP-DD uses common ground (GND)for all signals and supply (power). All are common within the QSFP-DD module and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal-common ground plane.

Note 2: VccRx, VccRx1, Vcc1, Vcc2, VccTx and VccTx1 shall be applied concurrently. Requirements defined for the host side of the Host Card Edge Connector are listed in Table 7. VccRx, VccRx1, Vcc1, Vcc2, VccTx and VccTx1 may be internally connected within the module in any combination. The connector Vcc pins are each rated for a maximum current of 1000 mA.

Note 3: All Vendor Specific, Reserved, No Connect and ePPS (if not used) pins may be terminated with 50 Ohms to ground on the host. Pad 65 (No Connect) shall be left unconnected within the module. Vendor specific and Reserved pads shall have an impedance to GND that is greater than 10 kOhms and less than 100 pF.

Note 4: Plug Sequence specifies the mating sequence of the host connector and module. The sequence is 1A, 2A, 3A, 1B, 2B, 3B. (see Figure 2 for pad locations) Contact sequence A will make, then break contact with additional QSFP-DD pads. Sequence 1A,1B will then occur simultaneously, followed by 2A,2B,followed by 3A,3B.

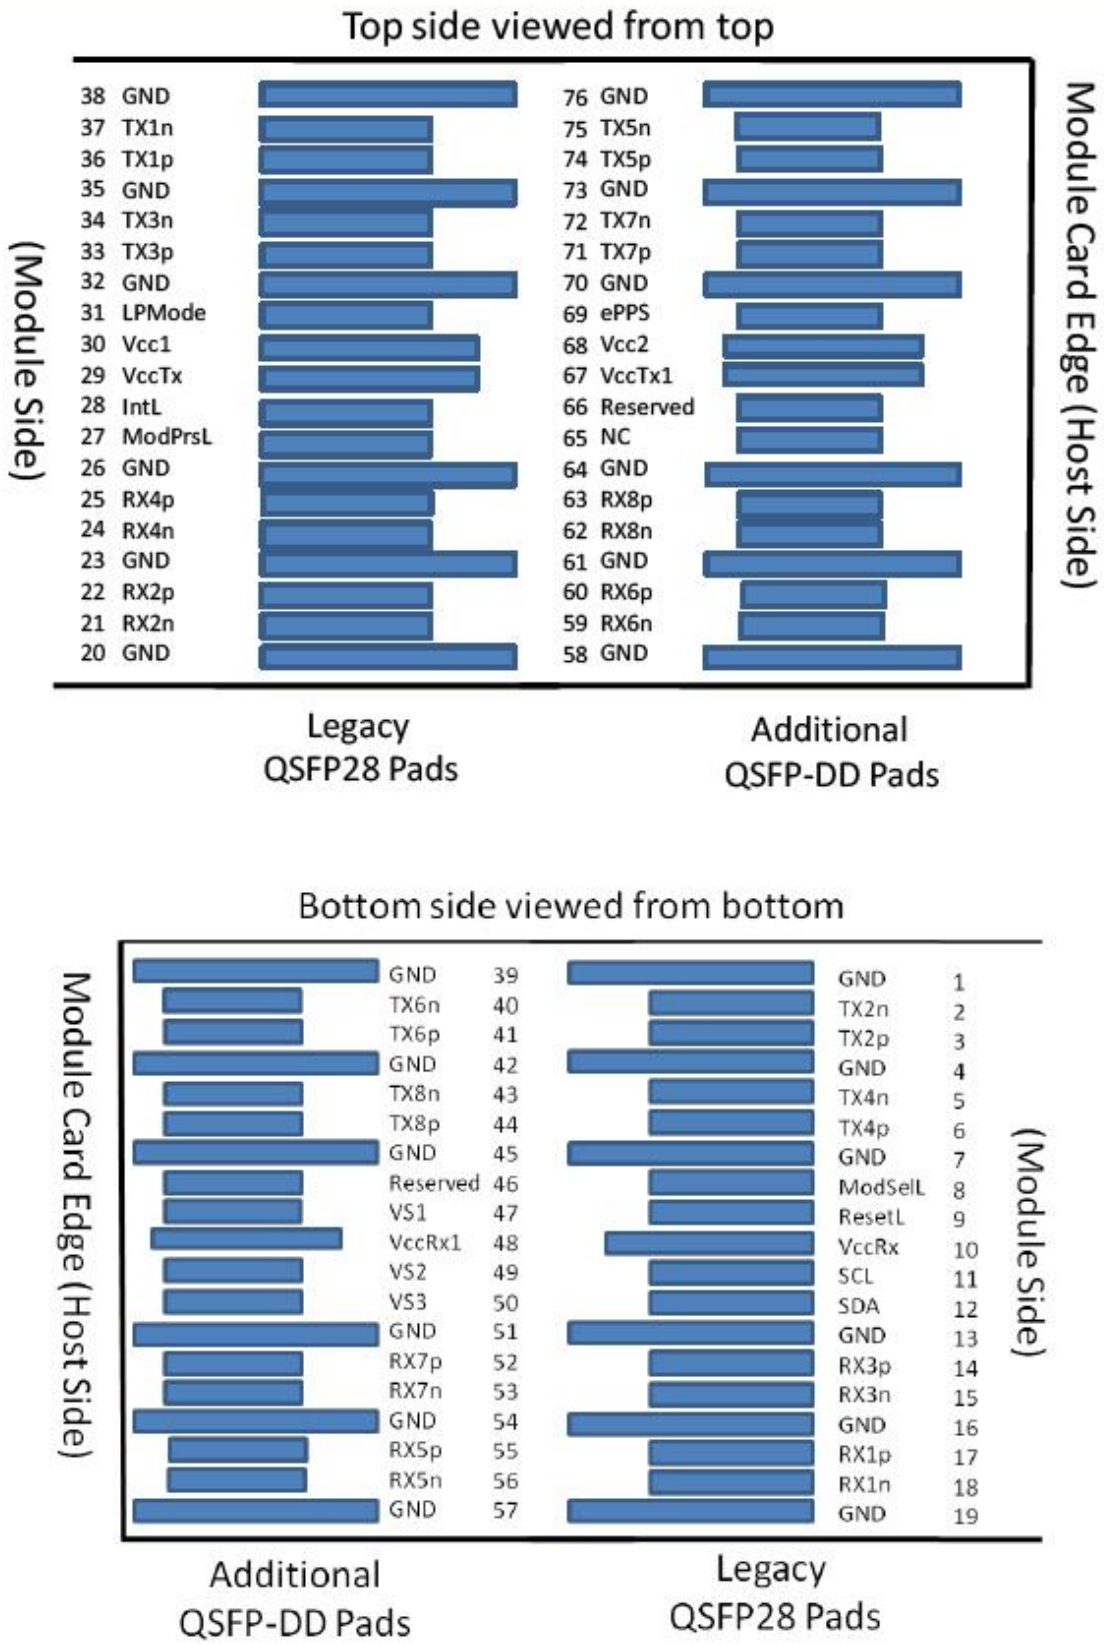

**Figure2. Electrical Pin-out Details**

### ModSelL Pin

The ModSelL is an input signal that shall be pulled to Vcc in the QSFP-DD module. When held low by the host, the module responds to 2-wire serial communication commands. The ModSelL allows the use of multiple QSFP-DD modules on a single 2-wire interface bus. When ModSelL is “High”, the module shall not respond to or acknowledge any 2-wire interface communication from the host.
In order to avoid conflicts, the host system shall not attempt 2-wire interface communications within the ModSelL de-assert time after any QSFP-DD modules are deselected. Similarly, the host must wait at least for the period of the ModSelL assert time before communicating with the newly selected module. The assertion and de-asserting periods of different modules may overlap as long as the above timing requirements are met.

### ResetL Pin

The ResetL signal shall be pulled to Vcc in the module. A low level on the ResetL signal for longer than the minimum pulse length (t_Reset_init) initiates a complete module reset, returning all user module settings to their default state.

### LPMode Pin

LPMode is an input signal. The LPMode signal shall be pulled up to Vcc in the QSFP-DD module. LPMode is used in the control of the module power mode. See CMIS Section 6.3.1.3.

### ModPrsL Pin

ModPrsL shall be pulled up to Vcc Host on the host board and pulled low in the module. The ModPrsL is asserted “Low” when the module is inserted. The ModPrsL is deasserted “High” when the module is physically absent from the host connector due to the pull-up resistor on the host board.

### IntL Pin

IntL is an output signal. The IntL signal is an open collector output and shall be pulled to Vcc Host on the host board. When the IntL signal is asserted Low it indicates a change in module state, a possible module operational fault or a status critical to the host system. The host identifies the source of the interrupt using the 2-wire serial interface. The IntL signal is deasserted “High” after all set interrupt flags are read.

### Power Supply Filtering

The host board should use the power supply filtering shown in Figure3.

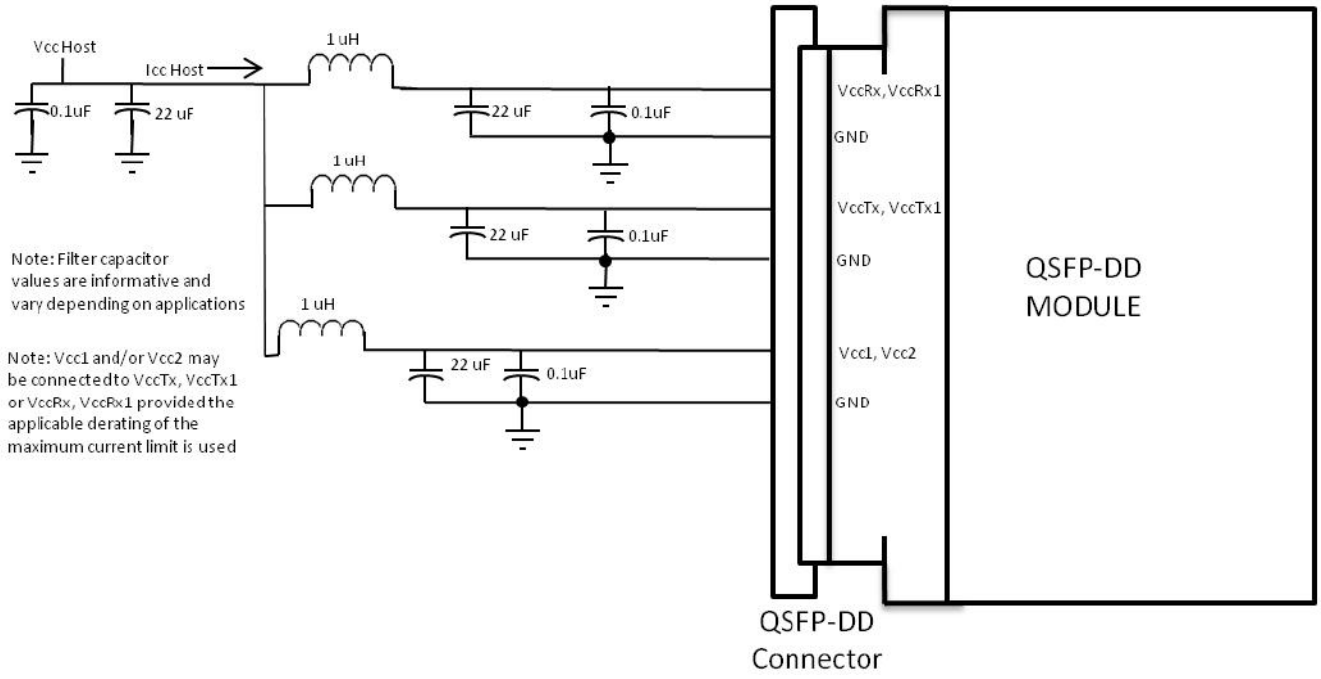

**Figure3. Host Board Power Supply Filtering**

## DIAGNOSTIC MONITORING INTERFACE

Digital diagnostics monitoring function is available on all Gigalight OSFP products. A 2-wire serial interface provides user to contact with module.

### Memory Structure and Mapping

This limits the management memory that can be directly accessed by the host to 256 bytes, which is divided in Lower Memory (addresses 00h through 7Fh) and Upper Memory (addresses 80h through FFh).

A larger addressable management memory is required for all but the most basic modules. This is supported by a structure of 128-byte pages, together with a mechanism for dynamically mapping any of the 128-byte pages from a larger internal management memory space into Upper Memory the host addressable space.

The addressing structure of the additional internal management memory is shown in Figure 4 The management memory inside the module is arranged as a unique and always host accessible address space of 128 bytes (Lower Memory) and as multiple upper address subspaces of 128 bytes each

(Pages), only one of which is selected as host visible in Upper Memory. A second level of Page selection is possible for Pages for which several instances exist (e.g. where a bank of pages with the same Page number exists).

This structure supports a flat 256 byte memory for passive copper modules and permits timely access to addresses in the Lower Memory, e.g. Flags and Monitors. Less time critical entries, e.g. serial ID information and threshold settings, are available with the Page Select function in the Lower Page. For more complex modules which require a larger amount of management memory the host needs to use dynamic mapping of the various Pages into the host addressable Upper Memory address space, whenever needed.

**Note**: The management memory map has been designed largely after the QSFP memory map. This memory map has been changed in order to accommodate 8 electrical lanes and to limit the required memory space. The single address approach is used as found in QSFP. Paging is used in order to enable time critical interactions between host and module.

### Supported Pages

A basic 256 byte subset of the Management Memory Map is mandatory for all CMIS compliant devices. Other parts are only available for paged memory modules, or when advertised by the module. See CMIS V4.0 for details regarding the advertisement of supported management memory spaces.

In particular, support of the Lower Memory and of Page 00h is required for all modules, including passive copper cables. These pages are therefore always implemented. Additional support for Pages 01h, 02h and bank 0 of Pages 10h and 11h is required for all paged memory modules.

Bank 0 of pages 10h-1Fh, provides lane-specific registers for the first 8 lanes, and each additional bank provides support for additional 8 lanes. Note, however, that the allocation of information over the banks may be page specific and may not to be related to grouping data for 8 lanes.

The structure allows address space expansion for certain types of modules by allocating additional Pages. Moreover, additional banks of pages.
